

## All - in- One Flexible Ingot Mold and Crucible Holder.

I have found this device excellent for pouring small amounts of metal, say 50 gms 18ct gold or 30 gms silver. The device consists of two plates of 6mm steel 25 x 100+mm. Two pieces of steel, 6mm x 6mm and a small piece, 6 x 6 x 6mm sandwiched between the longer pieces and held together with a rivet tightly enough to seal the mold but flexible, to enable the easy removal of the ingot. The flexible mold arms are sandwiched between the two steel plates and clamped together with a small G clamp. A second larger G clamp is used as a handle clamped onto the first G clamp. As the crucible and mold are all in one I get perfect pours every time. Remember to oil the mold and heat till the oil smokes before melting your metal. Practice, practice!
